Chart 7 instead displays the number, not the share, of acquisition types through time. It shows that the process of expansion remained active throughout the period, perhaps slowing down only in the post-crisis years.

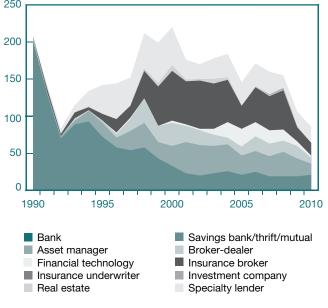

5.3 Evolution in Bank Families, or Organizational Changes in BHCs

The entity-level analysis in the previous subsection already hints at the evolution in complexity of U.S. banking firms. However, maintaining the focus on individual entities actually understates the extent to which bank organizational boundaries really expanded. Entity-level analysis misses the process of merging, changes in names, and branching into multiple levels of affiliation. As a result, entity, rather than family, analysis leaves us blind to the actual size and composition of entity families. For example, in Table 4, Bank of America and NationsBank are the first- and second-highest ranked entities by acquisition value. However, these entities are truly the same; most of NationsBank's history folded into Bank of America upon creation. Within this new entity are many enti-

ties acquired along the way, perhaps representing a diversified portfolio or a focused industry giant. To track complexity accurately through time, we need a picture of the same entity's organization before and after the deal.

As explained in section 4, our methodology allows us to combine and track overall complexity, as captured by the amount and type of performed acquisitions (and sales). This buildup takes place within the walls of a banking family, defined by aggregating the information of individual entities under a common highest-holder identifier.

What does the typical BHC family look like? How does its structure evolve over time? Chart 8 addresses these questions by depicting the evolution of organizational profiles in our sample. The typical BHC changed appreciably over time. A BHC family was identified by having mostly commercial bank and thrift subsidiaries in the early 1990s. However, the organizational boundaries expanded significantly starting in the mid-1990s, as BHCs began adding an increasing number of nonbank subsidiaries.

The process that we are able to pick up through the data on acquisition matches well the data on total assets of BHCs, depicted earlier in Chart 1, which shows the increasing

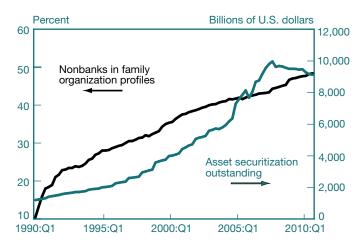

Source: Authors' calculations, based on data from SNL Financial. Note: Vertical cross-sections illustrate the average share of types within a bank family in a given quarter.

contribution of nonbank subsidiaries to the total assets of their organizations. This evolution in BHCs' organizational footprint also coincides closely with the concurrent evolution in asset-securitization activity. Chart 9 shows the time series of the ratio of nonbank subsidiaries to total subsidiaries of all the BHCs in our sample, together with the time series of total asset securitization outstanding. As the chart suggests, the organizational expansion of BHCs tracks quite closely the rise in securitization activity observed from the mid-1990s up to the financial crisis.

Table 5 shows snapshots of family complexity taken in a given year, capturing the number of both bank and nonbank entities amassed through the acquisition channel by the top fifty BHC families (ranked by total assets) up to that year. BHCs in the early 1990s were relatively simple in organizational structure. Among the top ten in 1990, only BankAmerica Corporation, back then a holding company headquartered in San Francisco, California, had performed ten nonbank acquisitions, and Security Pacific Corporation had performed seven. Among the remaining top fifty, Bank One and Barnett had performed five nonbank acquisitions each. Five years later, the picture was already quite different. The number of acquisitions was much higher, both within and across industries. Some

Chart 9 Nonbanks and Securitization

Notes: The black line illustrates the share (by count) of nonbanks in family organizational profiles. The green line illustrates asset securitization outstanding in billions of U.S. dollars.

families from 1990 had disappeared from the subsequent list as surviving ones absorbed them (BankAmerica, for instance, acquired Security Pacific).

The BHC organizational profiles only increase in complexity as time goes by, with very large numbers of entities wrapped under common ownership and control. Moreover, the lists show that the process takes place across institutions, and it is not a phenomenon confined to just the largest entities.

Another way to capture the sector-wide transformation is to look at time-series metrics of BHC structures. Chart 10, for instance, displays the average number of commercial banks acquired and kept within a family in a given year. This number, not surprisingly, steadily increases, again reflecting the process of geographic deregulation and consequent consolidation.

The number of nonbank acquisitions in Chart 9 could still fail to show true expansion across industries. For instance, BHCs could have performed many acquisitions concentrated in just one nonbank industry. In order to capture the extent of broad horizontal expansion, we calculate a Herfindahl-Hirschman Index (HHI) of industrial concentration. This index is 1 if the BHC has only commercial banks and smaller than 1 if the BHC acquires nonbank subsidiaries. Furthermore, it progressively decreases as the acquisition profile among the ten industries becomes more "diverse." In the same chart, we report the average HHI of BHC families over time. The steady downward trend shows a push toward broad expansion in organizational boundaries.
